VENTILATION REQUIREMENTS

Above is a diagram displaying the (3) cabinet cutout options for a properly ventilated environment.

The intake vents marked in green are required.

The ventilation process involves cold air entering the furniture at the base, passing through the cooling system, and warm air rising and escaping.

It is important to maintain a minimum clearance of 2 inches from the rear wall and 1.5 inches on the sides and top of the unit within the furniture cabinet. The cooling system requires unobstructed air circulation.

If ventilation grills are installed, each opening should have a minimum area of 32 square inches. Additionally, the unit should be placed on a level surface for optimal performance.
